

## Computer Graphics HW1

Haris Rao

### Kock Snowflake

- To run the html page, simple run the index.html file
- On the page you will see something like this :

- When you open the page the Snowflake will automatically initiate the iterations, I had to lock it to 5 iterations in the javascript file because any further than that was slowly down and eventually crashing the browser. If the iterations need to be changed for

testing purposes they are located under the “Koch” object under the variable names iterations.

- Press the Replay Button to restart the Snowflake process.
- Initially I started the HW by creating one line as shown in the Assignment description and mimicked that process. After that was ready then it was essentially rendering 3 lines as a triangle at the same time to mimic the Koch snowflake
